Tremor Ai — 30-Day Monthly Clinical Summary

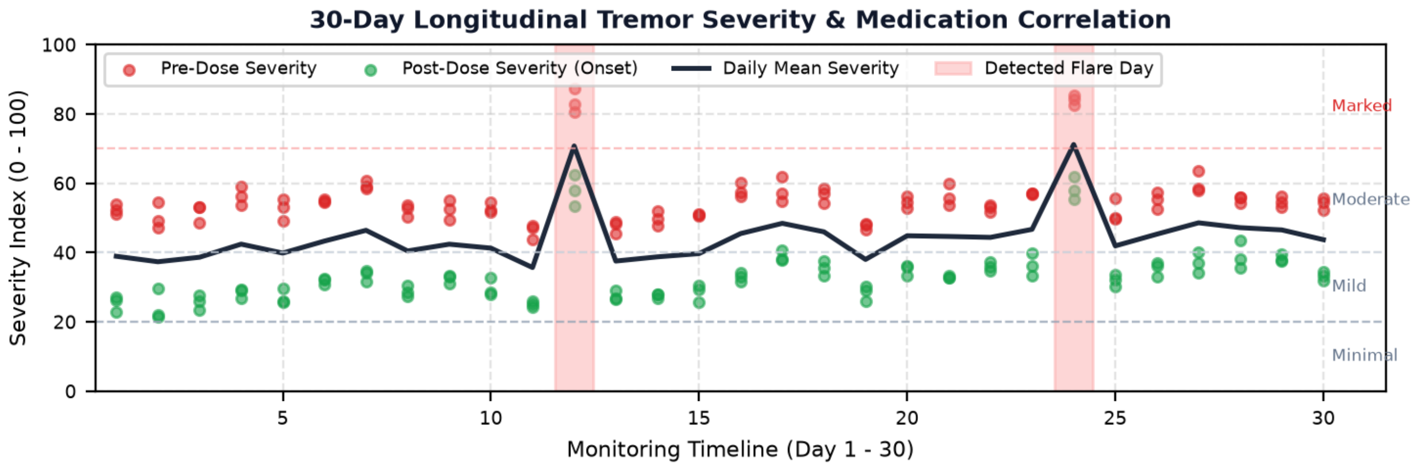
Physician Review Copy
Generated: 2026-09-05

Patient ID:	PD_01	**Regimen:**	Carbidopa/Levodopa 25/100 mg TID
Monitoring Window:	30 Calendar Days	**Total Doses Logged:**	90 scheduled doses
Telemetry Readings:	180 window assessments	**Device Hardware:**	Wearable Ring (MPU6050 IMU)

Medication-Effectiveness Correlation Verdict: **LIKELY EFFECTIVE** (Confidence: 96%)

Core Findings: Consistently demonstrated post-dose symptom reduction across 100.0% of doses (mean drop: 22.2 severity pts, 40.3%). Stable therapeutic window maintained.
Dose Response Rate: 100.0% of doses showed significant symptom reduction (Mean drop: 22.2 severity points).

Longitudinal Tremor Severity Progression (30 Days)



Longitudinal Progression: Baseline Comparison (Week 1 vs. Week 4)

Monitoring Interval	Mean Pre-Dose Severity	Mean Post-Dose Severity	Net Medication Drop	Clinical Fluctuation Note
Week 1 (Days 1 - 7)	53.9 / 100	28.0 / 100	**-25.9 pts**	Robust therapeutic response; predictable ON phase window
Week 4 (Days 24 - 30)	59.3 / 100	39.1 / 100	**-20.2 pts**	Contracted therapeutic window; emerging wearing-off observed

Flagged Acute Flare Incidents (Non-Medication Spikes)

Calendar Day	Observed Day Severity	Baseline Elevation	Clinical Correlation Guidance
Day 12	**70.7 / 100**	+26.2 pts above mean	Investigate external factors (sleep disruption, infection, acute stress, physical fatigue)
Day 24	**71.1 / 100**	+26.6 pts above mean	Investigate external factors (sleep disruption, infection, acute stress, physical fatigue)

METHODOLOGY DISCLOSURE: In accordance with clinical trial protocol benchmarks, this 30-day longitudinal record is a simulated multi-session timeline constructed by modeling diurnal variance, pharmacokinetics, and wearing-off kinetics based on standardized single-session clinical IMU recordings.

CLINICAL DECISION-SUPPORT NOTICE: Tremor AI is an investigational monitoring aid, NOT a diagnostic instrument or autonomous treatment recommendation tool. All longitudinal trends and medication response metrics are correlational patterns derived from simulated 30-day sensor telemetry. This report is intended exclusively to assist a licensed neurologist or attending physician in evaluating motor fluctuations. Dosage changes, prescription modifications, or treatment decisions must never be based solely on this automated summary.
